Subject: FW: Change of Speed Limit via Council Motion

Success!

Pretty soon, the Mayor will be able to take his NEV to the beach legally!!!!

LA Councilmember Traci Park will take the motion to reduce the speed on their stretch of Grand Avenu to the council!

Subject: Fwd: Change of Speed Limit via Council Motion

FYI, our policy team now has all of the information needed to make this happen. We'll get an update from Kevin soon on when we can introduce the motion.

Kevin:

The SBCCOG (Jacki Bacharach, Executive Director | 310-293-2612) and the City of El Segundo have asked for our support to change the speed limit on a very short part of Grand Avenue (between Vista Del Mar and the City of El Segundo boundary) that would lead from El Segundo to the beach. In El Segundo, the speed limit is 35 but when it gets to Los Angeles, it is 40 mph and prohibits the growing number of Neighborhood electric vehicles in El Segundo from legally getting to the beach.

While the City of Los Angeles does not have a speed survey for this portion of the street, according to the City of El Segundo Survey, Grand could be recommended for 35 mph (attached). After speaking with Tim Conger at LADOT, he instructed that we connect with the LAPD Traffic Division and get their approval for such a change.

Captain Applegate connected with West Traffic and got their sign-off. They are supportive of lowering the speed and increasing safety for drivers and pedestrians alike. He is cc'd here in case you need to connect with him.

Tim advised that our office can reduce the speed via council motion, similar to Jefferson at Culver Blvd. If you have any questions, please contact Tim at 626-378-7148.

Thank you, let me know if you have any questions.

Best,

Gaby

I. INTRODUCTION

Section 40802 of the California Vehicle Code requires that an engineering and traffic survey be conducted every seven years to establish or justify speed limits on streets and highways where enforcement involves the use of radar or other electronic devices which measure the speed of moving objects. Without such a survey, the use of radar for speed limit enforcement would constitute a "speed trap," which is prohibited by Section 40801 as an unacceptable enforcement procedure. This requirement does not apply to local streets and roads.

This report summarizes the results of an engineering and traffic survey that was conducted by the City of El Segundo to justify the posted speed limits on the City's arterial and collector streets. According to the Vehicle Code, it is not necessary to conduct the survey on local streets as they automatically have a *prima facie* speed limit of 25 miles per hour.

II. BACKGROUND

An engineering and traffic survey, as defined in Section 627 of the Vehicle Code, is "a survey of highway and traffic conditions in accordance with methods determined by the California Department of Transportation for use by the state and local authorities." The survey shall include consideration of all of the following:

- 1) Prevailing speeds as determined by traffic engineering measurements.
- 2) Collision Records.
- 3) Highway, traffic, and roadside conditions not readily apparent to the driver.

The California Department of Transportation (Caltrans) has adopted a set of guidelines for conducting engineering and traffic surveys to be used to establish or justify speed limits on city through highways, arterials, and collector streets. These guidelines are documented in Section 2B.13 of the "California Manual on Uniform Traffic Control Devices" (CA MUTCD, State of California Department of Transportation, March 29, 2019).

The practice of speed zoning (determining appropriate speed limits for each roadway segment) is based on the premise that a reasonable speed limit is one that conforms with the actual behavior of the majority of motorists, and that by measuring motorists' speeds, one will be able to select a speed limit that is both reasonable and effective. The first step in a speed zone survey, therefore, is to collect data on actual travel speeds on each roadway under consideration. The results of this speed survey are used to verify, increase, or decrease the existing speed limits or to establish new speed limits on streets that were not previously posted.

The suggested guideline from the CA MUTCD is that the speed limit should be established at the nearest 5 mile per hour increment of the 85th percentile speed, which is the speed at or below

which 85 percent of the traffic is moving. The speed limit may be set at a level that is lower than the nearest 5 mph increment by exercising one of the following two options.

Option 1 - The posted speed limit may be reduced by 5 mph from the nearest 5 mph increment of the 85th percentile speed if the conditions and justification for the lower speed limit are documented in an engineering and traffic survey that is approved by a registered Civil or Traffic Engineer.

Option 2 - For cases in which the nearest 5 mph increment of the 85th percentile speed would require a rounding up, then the speed limit may be rounded down to the nearest 5 mph increment below the 85th percentile speed, if no further reduction is used.

The second component of a speed zone survey is a review of the available collision statistics. The CA MUCTD guidelines suggest that a two-year collision record for each roadway section should be analyzed to determine if there is an abnormally high rate of collisions. If so, then the speed limit should be reduced to a level below the 85th percentile value, as determined by judgment.

The third consideration is the presence of any traffic conflicts or unusual traffic or roadside conditions which are not readily apparent to drivers. If such conditions are present, then the speed limit can justifiably be established at a speed lower than the 85th percentile speed.

III. DATA COLLECTION METHODOLOGY

The methodologies used for collecting and assembling the speed, traffic, and other necessary information are described below:

Vehicle Speeds

Vehicle speed data were collected at 45 locations within the City, which generally represent the street segments designated in the City of El Segundo General Plan Circulation Element as major arterial, secondary arterial, and collector streets (with the exception of Pacific Coast Highway, which is a State of California highway and is, therefore, surveyed by Caltrans). The speed statistics were surveyed with a radar speed meter by a private company under contract to the City of El Segundo. All of the locations were surveyed in August of 2019.

While conducting the surveys, the observer was positioned on straight roadway segments as far away as possible from a stop sign, traffic signal, bump, or other obstruction and surveyed both directions of travel in an inconspicuous manner. Periods of congested peak traffic activity were avoided, as were unusual conditions such as rainy weather, fog, an accident, or heavy school-related activities. The guideline was to survey a sample of 100 vehicles at each location. Copies of the radar speed survey sheets are provided in Appendix A.

Collision Statistics

As recommended in the CA MUTCD, a two-year history of collisions was reviewed as input for determining the appropriate speed limits. The City of El Segundo Police Department provided the collision statistics for this study. Data for the two-year period beginning January 1, 2017 and ending December 31, 2018 were used to determine the number of collisions along each street segment. The data represent the reported collisions that have occurred at locations throughout the City.

The collision rates (collisions per million vehicle-miles) were calculated for each street segment in the study area. The city-wide average collision rate is 0.87 collisions per million vehicle-miles (MVM). This rate was determined from 198 collisions over a two-year period on the City's 22.57 miles of streets that were included in this study. Collisions along Sepulveda Boulevard and on local streets were not included in the total, except for collisions that occurred at intersections with streets included in this speed survey. A summary of the collision data is presented in Appendix B.

Highway, Traffic, and Roadside Conditions

Another component of the engineering and traffic survey is an analysis of the existing highway, traffic, and roadside conditions. The information in this category includes traffic volumes, geometric features, roadway alignment, parking conditions, driveway activity, school activity, pedestrian concentrations, parks, and visibility deficiencies. The sources for this information include traffic count data, maps and plans on file at the City's Public Works Department, and field reconnaissance. The objective of this analysis was to identify traffic conflicts and unusual conditions which are not readily apparent to the driver. If such unexpected conditions are present, then speed limits below the 85th percentile speed may be warranted.

IV. APPROACH FOR SELECTING SPEED LIMITS

The information presented in Section III was used to determine the appropriate action to take regarding the speed limits on each street segment; i.e., whether to increase, decrease, or maintain the current speed limits. The approach for selecting the proper speed limit was to start with the 5 mile per hour increment nearest the 85th percentile speed, then determine if there should be a reduction based on the collision records or the presence of any unusual highway, traffic, or roadside conditions not readily apparent to a motorist. A higher than average collision rate and/or unique conditions are considered as justifications for decreasing the speed limits from the level preliminarily indicated by the speed survey. For this study, a roadway was considered to have a high collision rate if the collision rate exceeded 1.74 collisions per million vehicle miles, which is double the City's average collision rate.

As a final aid to establishing realistic speed zones, the following practical considerations were considered:

- Short speed zones should be avoided.
- Speed zone changes should be coordinated with visible changes in roadway conditions or roadside development.
- Speed zoning should be coordinated between adjacent jurisdictions to assure compatibility.

The study described in the preceding pages is applicable to the non-state roadways in the City of El Segundo. Speed zoning studies have previously been performed by Caltrans for State Route 1 (Pacific Coast Highway).

V. SUMMARY OF FINDINGS AND RECOMMENDATIONS

Based on the data and the analysis guidelines presented in the previous sections, the recommended speed zones were developed, as summarized in Table 1. The streets are presented in alphabetical order. The last two columns in Table 1 (under the "Speed Limit" heading) indicate the existing and recommended speed limits, respectively. The information used to develop the speed zones and the findings of the speed survey are summarized in Table 2.

In summary, the recommendation of the study is as follows:

Maintain the existing speed limits on 39 street segments.

Establish new speed limits on six street segments where speed limits are not currently posted, which include:

- Allied Way south of Hughes Way – 25 mph
- Apollo Street between Park Place and Rosecrans Avenue – 30 mph
- Atwood Way between Nash Street and Douglas Street – 35 mph
- Park Place east of Pacific Coast Highway – 25 mph
- Selby Street between Imperial Highway and Walnut Street – 30 mph
- Walnut Avenue between Pacific Coast Highway and Selby Street – 30 mph

Section 8-4-3 of the El Segundo Municipal Code titled “Special Speed Zones” should be amended as needed to reflect these changes and new speed limit signs should be installed on each street segment that is not currently posted with speed limit signs.

It is not necessary to list a street segment in the Municipal Code if the segment is in a residence or business district and if the recommended speed limit is 25 mph because the California Vehicle Code sets the *prima facie* limit at 25 mph in these districts. The street segments listed in the El

Segundo Municipal Code, therefore, reflect only the locations where the recommended speed limit deviates from the Vehicle Code *prima facie* speed limit.

Total/Average	22.57	13,820	96	102	0.87

* Collisions that occurred at the intersection of two of the surveyed streets are included in the data for both streets. The total number of collisions shown in the last row, therefore, is less than the sum of the numbers shown in the two collision columns.

** Collision Rate (collisions per million vehicle-miles) = $\frac{\text{Collisions} \times 1,000,000}{\text{No. of days} \times \text{length} \times \text{daily traffic}}$
